

LaSalle International provide solution for oil spill remediation project in Kuwait

Chatsworth, CA, March 1, 2015 - LaSalle International Inc., a noted global project management company, today announced the signing of an exclusive contract with Accell Technology to partner on an extensive oil spill remediation project in Kuwait. The United Nations mandated venture utilizes Accell's Black Cleaning Machine and their environmentally friendly biodegradable bacteria eating technology used so successfully in the BP Gulf oil spill.

The clean up will address the residual explosives and 2000 lakes containing oil from Kuwait's oil derricks created by the deliberate spill of millions of gallons of oil by Iraqi troops during the Persian Gulf War. The residual oil poses a high risk of contamination to ground water, and renders the soil hazardous for animal and plant production. The ten-year project will reclaim sand not currently used and eliminate the fire hazard and air pollution threat.

About LaSalle International Inc.
